

# Layers of the Rainforest

Cut and paste to match the name and information to each layer.

|  |  |
|--|--|
| <p><b>Canopy</b></p> <p>Home to more life than any of the other layers. Branches and climbing plants wrap around each other, creating a 'roof' for the layers below.</p> | <p><b>Understory</b></p> <p>Receives only around 5% sunlight and so is quite a dark place. Shrubs, bushes and younger trees occupy this layer.</p>                                     |
| <p><b>Forest Floor</b></p> <p>Receives only 2% sunlight and so not many plants grow here. It is home to the larger rainforest animals as well as many insects.</p>       | <p><b>Emergent Layer</b></p> <p>Home to the very tallest of the trees. The trees up here receive the most sunlight but must deal with very high temperatures and often high winds.</p> |

# Layers of the Rainforest **Answers**

Cut and paste to match the name and information to each layer.

## Emergent Layer

Home to the very tallest of the trees. The trees up here receive the most sunlight but must deal with very high temperatures and often high winds.

## Canopy

Home to more life than any of the other layers. Branches and climbing plants wrap around each other, creating a 'roof' for the layers below.

## Understory

Receives only around 5% sunlight and so is quite a dark place. Shrubs, bushes and younger trees occupy this layer.

## Forest Floor

Receives only 2% sunlight and so not many plants grow here. It is home to the larger rainforest animals as well as many insects.
