

Task:

Design an Animal

That would survive in a...

Rainforest

Climate:

Rainforests are warm and humid all year round.

Rainfall:

Rainforests have a lot of rainfall. This means that they can support a huge number of plants and animals all within a small area.

Trees, vines and other plants grow very close to one another, providing hiding spots for many small animals.

Some animals spend all their lives up in the trees; they never touch the ground!

Think:

What food or plants will your animal eat?

How will your animal move about in the rainforest? In which layer will it live?

What features will your animal need?

Draw your animal. Label its features, explaining how they would help it survive.
