

Cause and Effect

Sea Turtles

The sea turtle will choose a dry spot on the beach to dig her hole. In this hole, she will lay her eggs. This is because she wants to keep them safe from crabs and birds.

A female sea turtle usually lays between 80 to 120 eggs. The eggs are strong. This means that they do not break when they are dropped in the nest. The eggs hatch after about 60 days.

The baby turtles make their way to the water. If the babies hatch at night, most will make it safely to the water. If the babies hatch during the day, most will be eaten by crabs and birds.
