Edit the following passage about rainforests. Use the checklist to help.

Layers of a Rainforest

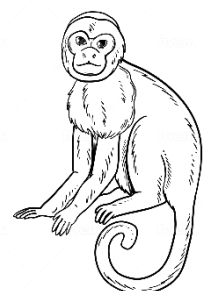

A very large number of plants grow in rainforests because there is so much sunlight and rainfall.

Rainforests also provide animals with many places to live. The largest rainforest in the world is the Amazon rainforest.

Rainforests have four main layers. The first layer is the forest floor. Very little sunlight reaches the forest floor and so it is very dark here. Above the forest floor is the understory. Shrubs, bushes, and younger trees are found in this layer. The canopy layer is like a roof over the rainforest. It is home to more life than any of the other layers. At the top is the emergent layer.

layer. The very tallest of the trees are found in this layer. The sunlight is very strong up this high
